Duct cleaning

The HVAC system serves as a means to distribute conditioned air throughout your building.

Unfortunately this can also be a means to distribute contaminants throughout the building.

If not properly maintained your system may harbor bacteria dust, pollen and moulds.

These can be a source of allergic reactions to your staff.

Duct cleaning also ensures your coils, condensate trays, fans and duct work are operating to optimum efficiency.

Canopy cleaning

The facts are that cooking exhaust systems represent a major fire hazard if not maintained properly.

Grease builds up in the canopy and duct work, which can ignite, causing a fire to engulf your premises.

Regular cleaning of the canopy and duct work ensures compliance to all insurance and legislative requirements and ensures optimum efficiency for your fan and impeller.
